

Personal Injury Case Study

Patient Evaluation

At Lake Worth Injury & Wellness, we recently treated a 64-year-old male patient who sustained a concussion and multiple spinal injuries following a fall. He presented with severe neck and back pain, radiating arm and leg symptoms, headaches, hand numbness, difficulty sleeping, and cognitive complaints including poor concentration and fogginess.

Assessment and Management of Care

On initial testing, he showed significant deficits: verbal memory at the 27th percentile, moderate visual memory impairment, and a high symptom score of 53. These findings confirmed objective concussion-related dysfunction that matched his reported symptoms.

On repeat testing, his scores improved dramatically: verbal memory jumped to the 95th percentile, visual memory and reaction time normalized, and symptom scores decreased.

The Value of ImPACT

- **Clinical care:** ImPACT results validated his cognitive deficits and guided our rehab plan, ensuring his care addressed both musculoskeletal and concussion-related components.
- **Patient confidence:** Seeing measurable improvements reassured him his brain was healing, even as spinal pain persisted.
- **Legal documentation:** Attorneys had objective before-and-after data that clearly demonstrated brain injury and recovery — evidence that an MRI or physical exam alone could not provide.

BILLING AND REIMBURSEMENT

Billing

- 966116 - Neurobehavioral Status Exam

Reimbursement

- 96116 - \$190.38

Dr. Craig Selinger, DC
Lake Worth Injury & Wellness

“ImPACT testing turned subjective concussion complaints into objective, defensible data. It guided care, reassured the patient and gave the attorney measurable proof.”
